

Meet the **M/29 Bullpup™** IV catheter system

The right line from the start

Simplicity of an IV cannula, 29 days dwell time

The **COVID-19** is here and with it, the workload of the healthcare system becomes a critical point to address. All the well-known problems of IV access are enhanced, in a few orders of magnitude

The problem:

Elder people are most affected

Longer stays in hospitals and ICU - Long term catheters are needed

Operating rooms, experts and sterile environment are scarce and in high demand

Resources are focused on the virus battle

Fewer and faster techniques with the minimum manipulation are recommended to reduce the risk of infection of the patient and medical professionals

The M/29 BullPup:

Specially designed to reduce the number of replacements and save the veins from over-use

Single insertion up to 29 days of dwell time

Can be inserted by any trained IV user

Reduces replacements and nurses time and resources

Reduce the number of insertions hence reduces exposure of the care worker and save the need for frequent re-starts
